

About Webyog support and about this FAQ: Problem with backtick-character in FAQ

In some cases you will see SQL-snippets here using the backtick/backquote character. They do not display correctly and as a consequence you cannot always copy/paste SQL from the FAQ pages and execute successfully against MySQL. This is an issue with this FAQ software itself. This FAQ is created in order to demonstrate the issue to PhpMyFAQ developers.

This is entered from the FAQ admin backend GUI-editor

(and should display as `<backtick>backtick<backtick>`): ``backtick``

.. but it does not - backticks are displayed as another type of quote (they are saved correctly in MySQL)!
