HTTP(s)-tunneling: Internal web server error / HTTP error 500

If you get this error (when HTTP-tunnelling in SQLyog and when connecting from a browser respectively) please check that that the permission setting for the SQLyog tunneller file is (in octal notation) 644. That means read permission for both 'owner', 'group' and 'all' and write permission for 'owner' (only). For details please refer to **this FAQ**.
