

MySQL bugs that affect SQLyog: UPPERCASE in table names are LOWERCASE'd

The early releases of MySQL server series 4.1.x had a bug that was corrected with the release of MySQL version 4.1.13. In the MySQL bugs repository it is described here:

<http://bugs.mysql.com/bug.php?id=9660> .

This bug means that the server directive *lower_case_table_names=2* does not have effect on InnoDB tables when server is running on Windows platform.

As a consequence of that the SQLyog CREATE TABLE and ALTER TABLE dialogues cannot save UPPERCASES in table names. They are saved as LOWERCASE.

Unique solution ID: #1013
